WEEKLY TRADING PERFORMANCE REPORT

Analysis Period:	March 30 - April 3, 2026 (Week 1, Account 2)
Report Generated:	April 4, 2026
Trader:	James
Account:	$500,000 paper (reset for live trading preparation)
Strategies:	Bear Call Spreads | Bull Put Spreads | Iron Condors | 0DTE
Market:	HIGH VOL — VIX 31. Iran conflict week 5. Bearish-to-bullish whipsaw. Holiday-shortened.

EXECUTIVE SUMMARY

Overall Performance: -$25,479 across 16 trades (68.8% win rate). A week of extremes. The clean, in-system trading generated +$26,618 across 12 trades with an 83% win rate — including the largest single-trade win to date (+$16,000 on a 500-lot SPY bull put spread) and +$11,200 on an 800-lot SPY bear call spread. Against this, the SNDK roll disaster (-$51,957) and OCO platform errors (-$140) created a -$52,097 error deficit that overwhelmed the system profits.

Key Findings:

- Clean system P&L;: +$26,618 (12 trades, 83% win rate). The strategy is generating significant premium income.
- SPY trades: +$36,540 across 7 positions. SPY is now the proven arena — liquid, no single-stock event risk, massive premium available.
- SNDK roll: -$51,957 (ERROR). Rolled a losing bear call spread into a wider spread during an adverse move, amplifying the loss. Largest single-trade loss ever.
- Position sizing scaled dramatically: 99, 100, 200, 500, 800 contract trades. The $500k account enables this but the SNDK loss shows what happens when size meets a mistake.
- OCO platform issues persist: 3 ghost trades from OCO malfunctions. Known TOS issue but still creating noise.
- Market closed Friday (Good Friday) — holiday-shortened week.

Strategic Assessment: The first week of Account 2 demonstrates both sides of the coin. The premium selling system — particularly on SPY — is now producing institutional-scale returns: $16,000 on a single 0DTE bull put spread, $11,200 on an 800-lot bear call spread. These are the trades the system was designed for. The SNDK loss is a familiar pattern: a single-stock position that moved against, combined with a decision (the roll) that amplified the damage instead of containing it. The takeaway is clear: SPY is the core venue; single-stock spreads carry event risk that the framework hasn't fully solved.

WEEKLY P&L; SUMMARY

Strategy	Trades	Wins	Losses	Win %	Net P&L
Bear Call Spreads (clean)	7	5	2	71.4%	+$4,558
Bull Put Spreads	5	5	0	100%	+$22,060
SNDK Roll (ERROR)	1	0	1	—	-$51,957
OCO Ghost Trades (ERROR)	3	0	2	—	-$140
TOTAL	**16**	**10**	**5**	**68.8%**	**-$25,479**
TOTAL ex-errors	**12**	**10**	**2**	**83.3%**	**+$26,618**

Account 2 Week 1. This is the first report of the new $500k paper trading account. Cumulative tracking resets from here.

P&L; BY UNDERLYING (CLEAN TRADES ONLY)

Underlying	Trades	Win Rate	P&L	Assessment
SPY	7 (incl IC)	86%	+$36,540	Core venue. Liquid. No event risk.
MU	3	100%	+$4,983	Bear calls worked well in bearish regime.

Underlying	Trades	Win Rate	P&L	Assessment
SNDK (clean)	2	0%	-$14,925	Bear calls on single stock. Event risk.

MARKET CONTEXT

Holiday-shortened week (Good Friday closure April 3). Iran conflict entering its fifth week dominated sentiment throughout, with oil prices surging to $111.54 by Thursday. Markets whipsawed between bearish and bullish as peace speculation and escalation rhetoric alternated daily.

Monday (30 Mar): VIX at 31. Markets edged higher. Your heaviest trading day — SPY and MU bear call spreads captured premium in the bearish/high-vol environment.

Tuesday (31 Mar): Biggest rally since May — S&P; +2.9%, Nasdaq +3.8% on Iran peace speculation. Oil retreated from highs. This is when SNDK bear calls were caught offside and the roll happened.

Wednesday (1 Apr): Trump tariff speculation drove bullish sentiment. Your 500-lot SPY BPS and 200-lot BPS both expired worthless for +$18,400 combined.

Thursday (2 Apr): Mixed sentiment. Tariff rally fading. 800-lot SPY BCS expired for +$11,200. Oil surged 11.4% on fears Iran war could drag on.

Friday (3 Apr): Markets closed (Good Friday). Jobs report: +178k (vs 60k expected).

INDIVIDUAL TRADE DETAILS

BEAR CALL SPREADS (+$4,558 clean / -$47,399 with SNDK roll)

#	Ticker	Strikes	Cts	Entry	Exit	P&L	Notes
78	MU	390/400	10	$0.36	$0.13	+$230	64% capture
79	MU	370/380	10	$1.34	$0.25	+$1,090	81% capture
80	MU	365/375	99	$1.04	$0.67	+$3,663	36%. Conviction sizing.
81	SPY	644/649	100	$0.57	$0.24	+$3,300	58% capture. Quarterlys.
84	SNDK	635/647.5	30	$2.05	$3.95	-$5,700	SNDK moved against.
85	SNDK	645/662.5	25	$1.86	$5.55	-$9,225	Wider spread, larger loss.
88	SNDK	670-700 (roll)	69			-$51,957	ERROR. Roll amplified loss.
92	SPY	660/665	800	$0.14	$0.00	+$11,200	Expired. 800 contracts!

BULL PUT SPREADS (+$22,060)

#	Ticker	Strikes	Cts	Entry	Exit	P&L	Notes
86	SPY	635/630	20	$0.30	$0.00	+$600	Expired. Quarterlys.
87	SPY	645/640	10	$0.16	$0.00	+$160	Expired. Quarterlys.
89	SPY	635/630	100	$0.31	$0.02	+$2,900	Overnight theta. 94%.
90	SPY	645/640	200	$0.12	$0.00	+$2,400	0DTE expired.
91	SPY	655/650	500	$0.32	$0.00	+$16,000	LARGEST WIN. 500 cts.

Five SPY bull put spreads, all winners, all expired worthless or near-worthless. Total: +$22,060. Trade 91 is the largest single-trade profit to date: 500 contracts, $655/$650 BPS, 0DTE, +$16,000. This is what the system looks like when execution and market read align.

ERROR TRADES (-$52,097)

#	Trade	Error Type	P&L	Detail
77	SPY IC	OCO malfunction	-$20	Legs closed separately due to platform issues.
82	SPY BCS Ghost	OCO reopened	+$0	Immediately closed at breakeven. Commission waste.
83	MU BCS Ghost	OCO reopened	-$120	Reopened at worse price. Closed quickly.
88	SNDK BCS Roll	Roll into wider spread	-$51,957	Rolled up from 670/682.5 to 685/700 via condor order. SNDK continued rallying through both.

SNDK: THE ROLL THAT COST $51,957

SNDK bear call spreads were opened on Tuesday when the market was bearish. Then the biggest rally since May hit — S&P; +2.9% on Iran peace speculation. SNDK rallied through the short call strikes on trades 84 and 85.

Rather than closing for the -$14,925 loss across those two positions, the decision was made to roll: the 670/682.5 spread was rolled up to 685/700 via a condor order for $0.30 credit. SNDK continued to rally through the new strikes. The roll increased exposure to the move rather than reducing it, and the wider 685/700 spread with 69 contracts created massive downside. Final loss on the rolled position alone: -$51,957.

Why Rolling Was the Wrong Move:

Rolling a losing position up into wider strikes during an adverse move amplifies the directional bet. You're not reducing risk — you're doubling down on the thesis (bearish on SNDK) at a worse entry point. The $0.30 credit on the roll was trivial compared to the additional risk taken on.

The Rule:

Don't roll losing positions. Close and reassess. A roll is not risk management — it's a new trade masquerading as a fix. If the thesis is wrong, accept the loss and move on. Closing at -$14,925 would have been painful but survivable. The roll turned it into -$66,882 total SNDK exposure.

RISK FRAMEWORK ASSESSMENT

Rule	Tested?	Outcome
R1: 50% profit limit	Yes	MU BCS trades captured 36-81%. Working.
R2: 100% premium stop	Yes	SNDK losses contained on trades 84/85. Working.
R7: Limit orders only	Yes	All entries via limits. Clean.
R10: No stop = no trade	N/A	Stops were set on all intentional trades.
R14: Max 2 correlated	Partially	3 MU trades same day = correlated but all won.
NEW: Don't roll losers	Violated	SNDK roll amplified loss by $37,000+.

New Rule #17: No Rolling Losing Positions

If a spread is losing, close it. Do not roll to wider strikes, further dates, or different structures. A roll is a new trade that requires its own thesis, not a bandage on a failing position. Source trade: SNDK #88 (-$51,957).

POSITION SIZING ANALYSIS

Trade	Contracts	Premium	Max Risk	% of Account
MU 365/375 BCS	99	$10,296	$88,704	17.7%
SPY 644/649 BCS	100	$5,700	$44,300	8.9%
SPY 635/630 BPS (overnight)	100	$3,100	$46,900	9.4%
SPY 645/640 BPS (0DTE)	200	$2,400	$97,600	19.5%
SPY 655/650 BPS (0DTE)	500	$16,000	$234,000	46.8%
SPY 660/665 BCS (0DTE)	800	$11,200	$388,800	77.8%
SNDK rolled spread	69	$14,628	$88,872	17.8%

Note: The 500-lot and 800-lot SPY trades had max risk of $234k and $389k respectively — 46.8% and 77.8% of the account. These worked because SPY 0DTE on clear directional days with tight OTM strikes has a very high probability of expiring worthless. But the max risk numbers are sobering. If SPY had reversed intraday, the 800-lot at $5 wide = $400k max loss would have been account-ending. The win rate on these is high, but one miss at these sizes would be catastrophic. Consider whether this sizing is appropriate for live trading or only paper.

LESSONS LEARNED

WHAT WORKED

- ✓ SPY as core venue: +$36,540 across 7 trades. Liquid, no event risk, massive premium. This is the arena.
- ✓ Bear call spreads in bearish regime: MU trades captured 36-81% of premium. Clean reads.
- ✓ 0DTE expired trades: +$29,600 from SPY positions that expired worthless. Theta decay on directional conviction.
- ✓ Conviction sizing: Trade 80 (99 cts MU) and trade 91 (500 cts SPY) both worked. When the read is right, size pays.
- ✓ Clean execution: 12 of 16 trades executed without error. System is operational.

WHAT NEEDS IMPROVEMENT

- **1. Never Roll Losing Positions:** The SNDK roll turned a -$14,925 loss into -$66,882. Rolls increase exposure to the same thesis at a worse entry. Close and reassess instead. New Rule #17.
- **2. Single-Stock vs Index Risk:** SNDK accounted for -$66,882. SPY accounted for +$36,540. The data is overwhelming: SPY eliminates the corporate event risk that has caused every catastrophic loss (SNDK secondary, AVAV earnings, GOOGL thesis failure). Concentrate on SPY.
- **3. OCO Platform Issues:** Three ghost trades this week. -$140 in direct cost plus $260 in wasted commissions. Known TOS issue. Verify all OCO brackets after every fill. Add to post-trade checklist.
- **4. Max Risk at Scale:** The 800-lot SPY trade had $389k max risk on a $500k account. That's 78% of the account on one position. For paper trading this is acceptable for testing conviction. For live trading, consider whether any single position should exceed 20-30% max risk.

CONCLUSION

The Two Accounts in One Week: Clean system: +$26,618 (83% win rate, 12 trades). With errors: -$25,479. The gap is entirely SNDK roll + OCO ghosts. Strip out the roll and the system delivered the best week of your trading career.

SPY is the Answer: +$36,540 from SPY alone. No event risk, deep liquidity, predictable premium decay on 0DTE/overnight trades. The MU bear calls also worked well (+$4,983) but MU is still a single stock. The path forward is clear: SPY as the primary venue, single-stock spreads only at reduced size with tight stops.

The SNDK Roll is the Final Lesson: Don't roll losing positions. Close them. Every rule in the 17-rule framework exists because a specific trade proved why it's needed. Rule 17 cost $51,957 to write. Make sure it only costs that once.
