

WEEKLY TRADING PERFORMANCE REPORT

Analysis Period:	April 6-7, 2026 (Week 2, Account 2)
Report Generated:	April 8, 2026
Trader:	James
Account:	\$500,000 paper
Strategies:	SPY Bull Put Spreads & Bear Call Spreads (0DTE)
Market:	HIGH VOL — Iran war day 39. Trump 8pm Tuesday deadline. Intraday whipsaw.
Note:	Two-day trading week. No trading Wed-Fri.

EXECUTIVE SUMMARY

Overall Performance: -\$108,756 across 7 trades in a two-day trading week. The clean system trading was +\$29,989 across 5 trades with a 100% win rate — continuing the Account 2 pattern of strong core system performance. Then one trade on Tuesday afternoon (#99, SPY 658/660 bear call spread, 750 contracts) hit max loss for -\$138,750, overwhelming the entire week's profits and more.

Key Findings:

- Clean system: +\$29,989 across 5 trades (100% win rate). Core strategy working.
- Monday was clean: +\$25,744 across 4 SPY BPS trades, all closed by end of day or expired.
- Tuesday went wrong: The Trump 8pm Iran deadline was a known binary catalyst. Market whipsawed intraday — dropped sharply then recovered in final hour on Pakistan ceasefire news.
- Trade #99 hit maximum loss: 750 contracts, 2-point wide spread, 15 cent credit. Max loss = full spread width minus credit. -\$138,750 exact.
- Spread width too narrow for credit received: 2pt spread, 0.15 credit. The break-even win rate required ~92%. Mathematically a losing strategy.
- Account paused: No trading for remainder of the week to reset and learn from the loss.

Strategic Assessment: This is a textbook case of how a single undisciplined trade erases a week of clean work. The first four trades on Monday (+\$25,744) were exactly what the system was built to produce. Trade 99 violated multiple framework rules simultaneously: held 0DTE into a known binary catalyst (Trump's 8pm Iran deadline), used a spread width that required an unrealistic win rate, and failed to close when the underlying moved ITM. The loss wasn't a tail event — it was a predictable outcome of bad trade structure meeting known event risk.

WEEKLY P&L; SUMMARY

Strategy	Trades	Wins	Losses	Win %	Net P&L
SPY Bull Put Spreads (clean)	4	4	0	100%	+\$25,744
SPY Bear Call Spreads (clean)	1	1	0	100%	+\$4,245
SPY BCS (execution error)	1	1	0	—	+\$5
SPY BCS #99 (framework failure)	1	0	1	0%	-\$138,750
TOTAL	7	6	1	85.7%	-\$108,756
TOTAL ex-errors	5	5	0	100%	+\$29,989

CUMULATIVE ACCOUNT 2 TRACKING

Metric	Wk 1 (Mar 30-Apr 3)	Wk 2 (Apr 6-7)	Cumulative
Completed Trades	16	7	23
Clean Trades	12	5	17

Metric	Wk 1 (Mar 30-Apr 3)	Wk 2 (Apr 6-7)	Cumulative
Error Trades	4	2	6
Clean P&L	+\$26,618	+\$29,989	+\$56,607
Error P&L	-\$52,097	-\$138,745	-\$190,842
Total P&L	-\$25,479	-\$108,756	-\$134,235

The Clean System Signal Is Strong: +\$56,607 in clean P&L; across 17 trades in two weeks (83.3% and 100% win rates). The system produces money consistently. The -\$190,842 in errors is entirely attributable to four specific trades: SNDK roll (-\$51,957), SNDK bear calls x2 (-\$14,925 combined), and now SPY #99 (-\$138,750). Four trades. Every one of them violated a specific rule you have already written down.

INDIVIDUAL TRADE DETAILS

MONDAY APRIL 6 — CLEAN SWEEP (+\$25,744)

#	Ticker	Type	Strikes	Cts	Entry	Exit	P&L	Notes
93	SPY	BPS	651/646	800	\$0.19	\$0.07	+\$9,600	63% capture
94	SPY	BPS	654/650	500	\$0.20	\$0.00	+\$10,000	Expired worthless
95	SPY	BPS	657/656	104	\$0.11	\$0.00	+\$1,144	Expired worthless
96	SPY	BPS	645/640	500	\$0.18	\$0.08	+\$5,000	56% capture overnight

Four SPY bull put spreads, all winners. Monday closed slightly higher despite Iran tensions as markets waited for Trump's Tuesday deadline. All BPS strikes were safe — this is the system working exactly as designed.

TUESDAY APRIL 7 — THE LOSS (-\$134,500)

#	Ticker	Type	Strikes	Cts	Entry	Exit	P&L	Notes
97	SPY	BCS	662/665	849	\$0.13	\$0.08	+\$4,245	Clean. Closed for 38% capture.
98	SPY	BCS err	662/665	1	\$0.13	\$0.08	+\$5	ERROR. Mobile slip.
99	SPY	BCS	658/660	750	\$0.15	MAX LOSS	-\$138,750	ERROR. See analysis.

Trade 97 (the clean one): 849 contracts of the 662/665 bear call spread, sold for \$0.13 and closed for \$0.08 at +38% premium capture. This was executed correctly. The market was trading lower intraday, the call side was safe, and the exit was taken.

Trade 98 (the mobile slip): One contract of the same spread left open when closing #97. A manual execution error. Closed immediately for a tiny gain. Cost: effectively zero. Flagged as ERROR for process tracking.

TRADE 99: POST-MORTEM

Detail	Value
Position	SPY 658/660 Bear Call Spread, 750 contracts
Entry	\$0.15 credit per contract
Total Credit	\$11,250
Spread Width	\$2.00 (too narrow)
Max Loss	$(\$2.00 - \$0.15) \times 750 \times 100 = \$138,750$
Outcome	Held through close. Underlying moved into ITM range.
Actual P&L	-\$138,750 (full max loss)
Risk/Reward	12.3:1 (risking \$12.33 per \$1 collected)
Break-even Win Rate Required	~92.5%

The Market Context:

Tuesday April 7 had a known binary catalyst: Trump's 8pm ET Iran deadline. The market dropped 1.2% intraday on escalation fears, then recovered almost entirely in the final hour on news Pakistan was pushing for a ceasefire extension. SPY closed at 6,616.85, up 0.08% — a slim gain that masked massive intraday whipsaw. The short call strike at 658 was near or at the money during the late-afternoon rally back toward close.

Why This Trade Failed — Four Compounding Issues:

1. The Math Didn't Work From Entry:

- A \$2 wide spread for \$0.15 credit means you risk \$1.85 to win \$0.15 per share. That's a 12.3:1 risk/reward ratio. To break even, you need to win 92.5% of the time. Your clean system win rate is 100% this week, but 92.5% over the long run is unrealistic — even the best systematic traders run at 80-85%. The trade had negative expected value from entry. Compare to Monday's 654/650 BPS: \$4 wide, \$0.20 credit — still thin, but needed only 95% win rate with much more room to breathe on the underlying.

2. Known Binary Catalyst Held Into Close:

- Trump's 8pm ET Iran deadline was market-moving news pending after the close. Rule 11 of the framework (ODTE event/news filter) explicitly states: no ODTE premium selling on names with active corporate or macro events. The Iran deadline qualified as an active macro event. This trade should never have been opened for ODTE into that catalyst.

3. Stop Didn't Fire Due to End-of-Day Illiquidity:

- ODTE options in the final minutes of trading have evaporating liquidity. When the spread moved ITM, the stop order couldn't fill at the stop price. This is a known ODTE risk: you can't rely on stops in the last 30-60 minutes because market makers widen spreads dramatically or step away entirely. The only true protection for late-day ODTE is to close before liquidity dries up.

4. Held Through the Recovery Rally:

- When Pakistan news hit and the market rallied into the close, SPY moved back toward the 658 strike. This is the same freeze pattern documented in the GLW and SNDK losses from Account 1 — a position moves against you, you see it, and you don't close. With ODTE there's no tomorrow to wait for. Rule 12: Bounce = Exit. When the position moved ITM, it should have been closed regardless of stop status.

The Single Most Important Takeaway:

Trade 99 was not bad luck. It was not a tail event. It was a trade that was mathematically unprofitable from entry, opened into a known binary catalyst, held through illiquid end-of-day conditions, and not closed when the position went against you. Every failure mode had a pre-existing rule. None of them were followed.

FRAMEWORK VIOLATIONS (Trade 99)

Rule #	Rule	Status
N/A	Spread width must support realistic win rate	VIOLATED (12.3:1 R:R)
11	ODTE event/news filter	VIOLATED (Iran deadline)
12	Bounce = Exit	VIOLATED (held through recovery)
10	No stop = no trade	VIOLATED (stop ineffective on illiquid ODTE)
6	20% buying power reserve	Likely violated given position size

New Rule #18: Minimum Risk/Reward Ratio

Credit spreads must have a minimum credit of 20% of spread width. A \$2 wide spread requires minimum \$0.40 credit. A \$5 wide spread requires minimum \$1.00 credit. This ensures the break-even win rate stays at or below 80% — achievable territory for a well-executed system. Reject any trade where credit/width is below 20%. Source trade: SPY #99 (-\$138,750).

New Rule #19: No ODTE Into Known Binary Catalysts

This extends Rule 11 (ODTE event filter). Specifically: if there is a known market-moving event scheduled within 24 hours that has two distinct outcomes (war/peace, rate cut/hold, earnings beat/miss), no ODTE premium selling on SPY or single names. The Iran deadline was exactly this type of catalyst. The same rule would apply to Fed announcements, major earnings, and scheduled geopolitical deadlines. Source trade: SPY #99.

New Rule #20: Close ODTE 30 Minutes Before Close

Liquidity on ODTE options evaporates in the final 30 minutes. Stops cannot be relied upon in this window. Either close all ODTE positions by 3:30pm ET, or accept that any position held into the final 30 minutes carries binary outcome risk (full premium capture or full max loss, no middle ground). Source trade: SPY #99.

WHAT WORKED

- ✓ Monday SPY BPS sequence: 4 trades, 100% win rate, +\$25,744. Textbook execution.
- ✓ Trade 97: 849 contracts, 38% premium capture, closed cleanly. This is the model for late-day ODTE — take the profit, don't hold for more.
- ✓ Size consistency: All Monday trades in the 500-800 contract range. The scaling from Account 1 to Account 2 is holding.
- ✓ Clean system P&L: +\$29,989 for the week. The core strategy continues to work.
- ✓ Self-imposed trading pause: Stopping after the loss to prevent revenge trading or compounding errors.

WHAT NEEDS IMPROVEMENT

- **1. Pre-trade R:R Check:** Every credit spread needs a credit/width ratio check before entry. Below 20% = reject. This is a 10-second calculation that would have prevented #99.
- **2. Event Calendar Check:** Before any ODTE trade, check: is there a binary market-moving event scheduled within 24 hours? If yes, trade size must be cut dramatically or the trade must not happen at all.
- **3. Late-Day ODTE Discipline:** The last 30 minutes are no-trade territory for new positions and must-close territory for existing ones. Liquidity determines whether stops work.
- **4. Position Sizing vs Catalyst Risk:** 750 contracts on a \$2 wide spread exposed \$138,750 of max risk on the account. When binary catalysts are pending, position sizes must be cut to levels where a full loss is recoverable within 2-3 clean weeks.

CONCLUSION

The Pattern Continues: Two weeks into Account 2, the clean system has generated +\$56,607 across 17 trades with exceptional win rates (83.3% and 100%). The total account is -\$134,235 — entirely because of four specific error trades. The

gap between system performance and account performance is not noise or luck. It is the same pattern that drove Account 1 into the ground: individual trades that violate multiple framework rules simultaneously and blow up at scale.

The Hard Truth: The framework exists. It's 20 rules now, every one paid for. The issue isn't knowledge, it's execution under pressure. Trade 99 happened because a known binary catalyst was ignored, a mathematically unviable trade was entered, and the exit was not taken when the position went against you. Every one of those failures had a rule that would have prevented it.

The Week Paused Early: The decision to stop trading Wednesday through Friday after the loss is the right call. It prevents revenge trading and gives space to process what happened without the pressure of the next trade. This is discipline the Account 1 version of you didn't have.

The Key Question for Monday: What specific check in the pre-trade process would have prevented #99? If the answer is "the credit/width ratio check" — build that check into the entry routine as a hard gate. No trade passes without it. Write it on the desk if you have to. The system needs human-proof guardrails, not trader discipline.
