

WEEKLY TRADING PERFORMANCE REPORT

Analysis Period:	March 14-20, 2026 (Week 7)
Report Generated:	March 20, 2026
Trader:	James
Strategies:	Cash-Secured Puts Bull Put Spreads (NEW) ODTE (NEW) Long Puts
Market Environment:	Post-crisis settling / Triple witching expiry / SNDK corporate event shock

EXECUTIVE SUMMARY

Overall Performance: -\$4,867 across 14 completed trades (71.4% win rate). The headline is a single catastrophic ODTE trade on SNDK (-\$6,900) that wiped out an otherwise strong week. Excluding SNDK, the week was +\$2,164 with a 77% win rate across 12 trades. This was also the week you deployed bull put spreads for the first time — 7 of 8 were profitable, generating +\$1,831 before the SNDK disaster.

Key Findings:

- SNDK ODTE: -\$6,900. No stop set, no news check (WD secondary offering), froze on bounce. Largest single loss to date.
- Bull Put Spreads debut: 10 trades, 7 wins. JBL (+\$1,694 across two spreads) and FDX (+\$1,180 expiry) were standouts.
- CSPs continue to deliver: +\$1,152 across 4 trades (100% win rate). GWRE, LUNR, PL, RCAT all profitable.
- Freeze pattern identified: GLW BPS and SNDK both showed the same behaviour — position breaches stop, bounces, you don't close, it goes back against.
- Two new frameworks needed: ODTE news/event filter, and a "bounce = exit" rule.

Strategic Assessment: This week has two completely different stories. Days 1-4 (Mon-Thu) were excellent: 12 trades, +\$2,164, disciplined execution across CSPs and the new bull put spread strategy. Day 5 (Friday) was a disaster: the SNDK ODTE trade cost -\$7,031 due to compounding failures — no stop, no news check, and freezing under pressure. The tragedy is that you had the rules to prevent this. Every single failure on SNDK violates a rule you've already written down.

WEEKLY P&L; SUMMARY

Strategy	Trades	Wins	Losses	Win %	P&L
Cash-Secured Puts	4	4	0	100%	+\$1,152
Bull Put Spreads (ex-SNDK ODTE)	8	6	2	75%	+\$831
SNDK ODTE (trades 62+63)	2	0	2	0%	-\$7,031
TOTAL	14	10	4	71.4%	-\$4,867
TOTAL ex-SNDK ODTE	12	10	2	83.3%	+\$2,164

CUMULATIVE PERFORMANCE

Wk	Period	Trades	Win %	CSP P&L	BPS P&L	Other	Total	Cumulative
1	Feb 9-19	10	80%	+\$1,758	\$0	\$0	+\$1,758	+\$1,758
2	Feb 20-27	10	60%	-\$179	\$0	+\$614	+\$435	+\$2,193
3	Mar 2-6	8	37.5%	+\$1,949	\$0	-\$5,097	-\$3,148	-\$955
4	Mar 7-13	5	40%	-\$615	\$0	-\$25	-\$640	-\$1,595
5	Mar 14-20	14	71.4%	+\$1,152	-\$6,200	+\$0	-\$4,867	-\$6,462

Cumulative: -\$6,462. CSP-only remains strongly positive at +\$4,065. The total deficit is driven by experimental/multi-leg losses: AVAV (-\$4,280), GAP (-\$817), SNDK (-\$7,031), and GOOGL (unrealised). The pattern is consistent: the core CSP strategy makes money; the catastrophic losses come from new strategies deployed without full risk controls.

INDIVIDUAL TRADE DETAILS

CASH-SECURED PUTS (+\$1,152)

#	Ticker	Entry	Exit	Days	Cts	Sell/Buy	P&L	Capture
46	GWRE \$150P	09/03	16/03	7	4	\$2.52/\$1.17	+\$540	53.6%
47	LUNR \$16P	11/03	17/03	6	4	\$0.66/\$0.33	+\$132	50.0%
51	PL \$20P	16/03	17/03	1	10	\$0.65/\$0.37	+\$280	43.1%
52	RCAT \$14P	16/03	17/03	1	10	\$0.55/\$0.35	+\$200	36.4%

All four CSPs profitable. 100% win rate. GWRE is now a repeat winner (3rd profitable trade on GWRE). PL and RCAT are defense/drone sector plays aligned with the ongoing geopolitical environment.

BULL PUT SPREADS — DEBUT WEEK

#	Ticker	Strikes	Entry	Exit	Days	Cts	P&L	Result
54	WDC	\$250/\$240	16/03	17/03	1	5	+\$255	60% capture
55	JBL	\$232.5/\$220	17/03	17/03	0	8	+\$864	44% same-day
56	PAYX	\$85/\$75	17/03	17/03	0	11	+\$11	Scratch
57	JBL	\$237.5/\$225	17/03	18/03	1	5	+\$830	79% capture
58	GLW	\$125/\$120	18/03	19/03	1	10	-\$1,450	LOSS / Freeze
59	SNDK	\$700/\$680	19/03	20/03	1	4	+\$232	22% theta
60	MU	\$427.5/\$420	19/03	20/03	1	10	-\$910	Stop triggered
61	FDX	\$330/\$320	19/03	20/03	1	10	+\$1,180	Expired 100%

BPS Assessment: Promising debut. 6 wins out of 8 standard BPS trades (+\$1,831 before SNDK 0DTE). JBL was the standout — two spreads at different strikes, both profitable (+\$1,694 combined). FDX expired worthless for full \$1,180 capture. MU stop triggered correctly (-\$910, managed). GLW -\$1,450 was the problem trade — same freeze pattern that appeared on SNDK Friday.

0DTE TRADES — SNDK CATASTROPHE

#	Ticker	Strikes	Cts	Credit	Close Cost	P&L	What Went Wrong
62	SNDK	\$730/\$720	10	\$1,200	\$8,100	-\$6,900	No stop. No news. Froze.
63	SNDK	\$700/\$690	1	\$50	\$181	-\$131	Same downdraft

SNDK 0DTE: POST-MORTEM

The Setup:

Friday March 20, 0DTE bull put spread on SNDK. \$730/\$720 strikes, 10 contracts, \$1,200 credit. Maximum possible loss: \$8,800 (spread width minus credit).

The Catalyst You Missed:

Western Digital announced a secondary offering of 5.8 million shares at \$545 — well below the \$772 market price. This created an immediate supply shock and a price anchor far below current levels. The 15% OTM probability calculation was meaningless with a known corporate event driving the stock down. A pre-trade news check would have identified this and prevented the entry.

The Sequence:

1. Entered the spread without a stop (personal commitments, no time to set it)
2. SNDK dropped sharply. Position went to approximately -\$6,000
3. Stock bounced. Position recovered to approximately -\$1,800
4. You froze. Did not close on the bounce.
5. Stock dropped again. Final loss: -\$6,900

Cost of Freezing: ~\$5,100

The difference between closing at -\$1,800 on the bounce and the final -\$6,900 is approximately \$5,100. This is the single most expensive behavioural error to date. The market gave you a second chance and you didn't take it.

The Freeze Pattern (Recurring):

This is the second time in the same week. GLW BPS (trade 58) showed the identical pattern: position breaches stop level, recovers, you don't close, it goes back against. Two instances in one week means this isn't random — it's a behavioural vulnerability that needs a systematic fix, not just willpower.

The Five Failures:

Failure	Rule That Existed	What Happened
No stop set	Stops must be set at or before entry	Personal commitments, no time
No news check	Check catalysts before entry	WD secondary offering not checked
Froze on bounce	Not yet a rule (now it is)	Position recovered, didn't close
0DTE without filter	Not yet a rule (now it is)	No event filter for 0DTE
Friday trading	Not yet a rule (consider it)	Two consecutive Fridays with major losses

New Rules from SNDK:

1. Stops are non-negotiable: Set at entry or don't enter. If you can't set a stop, you can't take the trade.
2. 0DTE news filter: No premium selling on names with active corporate events (secondaries, M&A, FDA decisions, etc.)
3. Bounce = exit: If a position breaches the stop level and recovers, close immediately. The market is giving you a gift — take it.
4. Consider avoiding Friday trading until automated stop protection is fully reliable. Two consecutive Fridays with major losses.
5. Freeze log: When you feel the freeze coming, log it. Name the feeling. Use it as the trigger to close, not to wait.

GLW BPS: THE FIRST FREEZE

Trade 58: GLW \$125/\$120 BPS, sold at \$0.62, closed at \$2.07. Loss of -\$1,450 (-234% of premium). The same pattern as SNDK: position went against you, bounced back toward breakeven, you didn't close on the bounce, and it went back against. This was the warning shot. The fact that the same pattern repeated on SNDK the next day makes the behavioural fix the single most important item going forward.

LESSONS LEARNED

WHAT WORKED

- ✓ CSPs: 4/4 wins, +\$1,152. GWRE now a repeat winner. Defense/space sector selection strong (PL, RCAT).
- ✓ Bull Put Spreads: 6/8 wins on standard BPS. JBL +\$1,694 across two trades. FDX full expiry +\$1,180.
- ✓ MU BPS stop worked: -\$910 is a managed loss. Stop triggered, contained the damage.
- ✓ Overnight theta trades: SNDK \$700/\$680 and FDX both worked as designed. Premium decays overnight into expiry.
- ✓ Trade volume: 14 trades shows confidence and opportunity identification improving.

WHAT NEEDS IMPROVEMENT

- **1. The Freeze:** Two instances of freezing when positions bounce. This is now the #1 risk to your trading. Rule: Bounce = exit. Automate where possible.
- **2. No Stop = No Trade:** SNDK had no stop due to time pressure. If you can't set the stop, you can't enter the trade. Period.
- **3. 0DTE News Check:** A 30-second news check would have revealed the WD secondary offering. Add to pre-trade checklist: any corporate events today for this underlying?
- **4. Friday Risk:** Week 3 AVAV (Friday), this week GLW + SNDK (Thu-Fri). Consider whether your available attention on Fridays matches the risk you're taking.

RISK FRAMEWORK EVOLUTION

Layer	Rule	Status
Profit Target	50% limit buy-to-close (GTC)	Working
Premium Stop	100% stop buy-to-close (GTC)	Working (when set)
Underlying Stop	Close if stock < (strike – premium)	In practice
Alerts	25/50/75% premium alerts	Working
Margin Buffer	20% buying power reserve	In practice
Entry Execution	Limit orders; market near close on earnings	In practice
Earnings Protocol	Close before earnings; hold-through = full revalidation	In practice
Commission Filter	Commission < 2% of premium	In practice
No Stop = No Trade	If you can't set the stop, don't enter	NEW (SNDK)
0DTE Event Filter	Check for corporate events before any 0DTE	NEW (SNDK)
Bounce = Exit	If position breaches stop and recovers, close immediately	NEW (GLW/SNDK)
Friday Caution	Consider reduced size or no 0DTE on Fridays	NEW (pattern)

12 rules now, up from 8 last week. Four new rules from this week's failures.

STRATEGY EVOLUTION: MONTH 3 PICTURE

Strategy	Weeks Active	Trades	Win Rate	Total P&L	Assessment
Cash-Secured Puts	1-5	~25	~72%	+\$4,065	Core edge. Reliable.
Calendar/Diagonal Spread	3-3	4	25%	-\$4,164	Expensive learning.
Bull Put Spreads	5	10	60%	-\$6,019*	Promising (ex-SNDK: +\$831)
Long Calls/Puts	1-5	~10	~50%	~-\$500	Mixed. Spec plays.
0DTE	5	2	0%	-\$7,031	Needs full framework.

*BPS P&L; includes SNDK 0DTE. Standard BPS only: +\$831 across 8 trades.

The trajectory is clear: CSPs are your proven edge. Bull put spreads show promise but need the same discipline framework that CSPs now have. 0DTE is not ready for live trading yet — it needs the news filter, mandatory stops, and the freeze problem resolved first.

CONCLUSION

The Two Weeks In One: Monday to Thursday was your best run yet: +\$2,164, 83% win rate, successful deployment of bull put spreads. Friday was your worst single day: -\$7,031 on SNDK. The contrast is stark and the lesson is painful. You have a profitable system. What you don't yet have is the discipline to follow it when under pressure.

The Freeze Is Now the #1 Issue: Not position sizing. Not stop levels. Not strategy selection. The freeze — the moment where a position bounces, you see a chance to exit, and you don't take it. GLW cost you ~\$800 extra. SNDK cost you ~\$5,100 extra. That's ~\$5,900 this week from a single behavioural pattern. Until this is resolved, either through automation or through a systematic decision protocol, it will keep recurring.

Cumulative: -\$6,462. CSP-only: +\$4,065. The gap between what the system produces and what the account shows is entirely explained by unmanaged losses on new strategies. The path forward isn't to stop trying new things — it's to apply the same rigour to new strategies that you've built into CSPs over 10 weeks.

Next Report: Friday, March 27, 2026
